

Year 6 Mathematics

Curriculum and assessment plan

Example

Level description	Context and cohort considerations
<p>In Year 6, learning in Mathematics builds on each student's prior learning and experiences. Students engage in a range of approaches to learning and doing mathematics that develop their understanding of and fluency with concepts, procedures and processes by making connections, reasoning, problem-solving and practice. Proficiency in mathematics enables students to respond to familiar and unfamiliar situations by employing mathematical strategies to make informed decisions and solve problems efficiently.</p> <p>Students further develop proficiency and positive dispositions towards mathematics and its use as they:</p> <ul style="list-style-type: none"> • expand the repertoire of numbers they work with to include rational numbers and the use of integers in practical contexts such as locating points in the 4 quadrants of a Cartesian plane • extend their knowledge of factors and multiples to understand the properties of prime, composite and square numbers • solve arithmetic problems involving all 4 operations with natural numbers of any size • use mathematical modelling to solve practical problems, choosing models, representations and calculation strategies and justify solutions • apply computational approaches to develop algorithms that use rules to generate numbers • develop a range of written and digital means for representing objects and three-dimensional spaces in 2 dimensions • apply their understanding of area and use multiplicative thinking to establish the formula for the areas of a rectangle • begin to formally use deductive reasoning in spatial contexts involving lines and angles • describe and compare probabilities numerically • determine the mode and range and discuss the shape of distributions in their reports of findings from their statistical investigations • observe and compare long-run frequencies in repeated chance experiments and simulations. 	<p>The Year 6 cohort participate in daily mathematics learning. This plan has considered:</p> <ul style="list-style-type: none"> • summative and formative data from Year 5 showing the need to support and extend on their emerging measurement and fractional understandings • exploration and use of digital tools, e.g. virtual material, electronic devices, simulation programs and dynamic geometric software, in relevant contexts that support the learning and doing of mathematics. <p>Across the year, the contexts for teaching and learning reflect authentic learning experiences for the students. Unit 2 provides an opportunity to connect statistical investigations to the Science learning area. Unit 4 provides an opportunity to engage in problem-solving using the Year 6 graduation dinner party as a context for learning.</p>

Unit 1 — Discovering rules and patterns	Unit 2 — Creative connections	Unit 3 — Exploring possibilities	Unit 4 — Taking action to plan a party
<p>Duration: 10 weeks</p> <p>Students develop their critical and creative thinking skills when they interpret mathematical concepts or problems by breaking them into component parts for analysis. This analysis can then be used to develop rules and make generalisations. In order to develop this understanding of rules and generalisations, students explore the properties of numbers, number patterns and the formula for the area of a rectangle.</p> <p>In the first phase of this unit, students investigate the properties of prime, composite and square numbers by using their understanding of factors and multiples from Year 5. Students continue to build upon this knowledge as they use physical materials to identify and explain how rules can be used to create visually growing patterns, e.g. using toothpicks or counters to create growing patterns with triangles or squares to explore composite and square numbers. Number understandings are deepened as students investigate numerical equations involving brackets and combinations of operations. Students recognise the need for an agreed set of rules when carrying out multiple operations within the one number sentence. They use this understanding to find unknown values in equations and construct number sentences involving combinations of the four operations and brackets. Students then apply their understandings of the properties of numbers and operations by using computational thinking skills with function machines to model operations. The function machines show students' ability to create algorithms with steps that generate sets of numbers.</p> <p>In the second phase of this unit, students use their understanding of multiplication and the properties of numbers to establish the formula for the area of a rectangle. Using one centimetre grid paper and the array structure, students draw a variety of rectangles and record the length of the sides and related areas of the rectangles. Through this exploration of relationships, students establish a formula for the area of a rectangle and make connections to why area is measured in squared units.</p> <p>Evidence of student learning from investigations throughout the unit is recorded in an investigation folio (annotated visually growing patterns, diagrams, number equations, explanations, function machine models, area of a rectangle representations).</p>	<p>Duration: 10 weeks</p> <p>When students consider approaches to mathematical problems, they develop flexible thinking as ideas are tested and trialled, and adjustments are made. Creative approaches also encourage connections between concepts and across learning areas. This unit provides opportunities to make connections between decimal representations and the metric system, integers on number lines and as coordinates on the Cartesian plane, and examine a statistical investigation within a Science context.</p> <p>In the first phase of this unit, students make connections between mathematical concepts by reviewing decimal number system understandings from Year 5 and applying this knowledge to add and subtract decimals and multiply and divide decimals by multiples of powers of 10. Students connect decimal representations to the metric system and use their proficiency with metric units from Year 5 to convert between common units of length, mass and capacity, considering the most appropriate unit to use in calculations. Students further establish mathematical connections by expanding their repertoire of numbers to include integers. They extend the number line to include negative numbers and explore practical contexts that include positive and negative integers, e.g. exploring elevators above and below ground level. Students then explore integers as coordinates on the Cartesian plane to make the connection that axes are number lines to locate points in the four quadrants of a Cartesian plane. Through practical explorations, students develop an understanding that the Cartesian plane provides a visual way of describing location, e.g. through playing games such as battleship and listing co-ordinates in the correct order to draw polygons. Evidence of student learning is collected in a supervised assessment task.</p> <p>In the second phase of this unit, in response to stimulus, students build on Year 5 understandings to interpret and compare data sets for ordinal and nominal categorical, discrete and continuous numerical variables using comparative displays or visualisations, e.g. dot plots, bar graphs, side-by-side column graphs. Digital literacy skills are developed as students analyse data and compare distributions in terms of mode, range and shape to identify patterns. They investigate data representations in the media and discuss how distributions illustrate and convey messages. Students then make connections between Mathematics and Science in a statistical investigation on how the growth and survival of plants is affected by changing the physical conditions. Students draw on their understandings of number and length to collect, record and represent continuous numerical data by measuring the height of plants over time. Using digital tools, students tabulate data and communicate findings with a line graph. Evidence of student learning is collected in a learning journal.</p>	<p>Duration: 10 weeks</p> <p>When exploring possible approaches it is important to change, combine or elaborate on ideas to find solutions. Digital tools can be used to select and control a variety of features to create digital content and communicate creative solutions. In this unit, students develop digital literacy skills in probability and spatial contexts.</p> <p>In the first phase of this unit, students apply their understandings of factors and multiples from Unit 1 to fraction denominators, e.g. thirds, sixths, ninths, twelfths. They explore equivalent representations of fractions (number lines, drawings and models), use their understanding of factors and multiples to make comparisons between these representations and explain the relationship between related denominators. Students then apply their understanding of fractions, decimals and percentage equivalents from Year 5 to multiple probability experiments within a project. Throughout the investigation report students compare outcomes recorded as common fractions and add and subtract fractions with related denominators using their understanding of equivalent fractions. Students assign probabilities and run simulations using digital tools, comparing observed frequencies to expected frequencies. They discuss how increasing the number of trials effects variation in results. Evidence of student learning will be demonstrated in their investigation report.</p> <p>In the second phase of the unit, students continue to explore possibilities in spatial contexts and build upon their prior knowledge of angles from Year 5. Students investigate parallel cross-sections of objects through hands-on experiences by slicing through models at different angles, e.g. vegetables or fruit, play dough models or foam objects. They observe and record the faces from different cross-sections by taking photographs and making annotations in a digital investigation folio. Students learn when making a cross-section cut parallel to the congruent end faces in a right prism, the cross-section is congruent to the end face. Hence, the naming convention for right prisms is according to these two congruent faces. Students then apply angle knowledge to identify the relationships between angles on a straight line, angles at a point and vertically opposite angles. In their digital folio, students create spatial representations and use number sentences to demonstrate their understanding of angle properties and how they are used to find unknown angles. Students then explore possibilities with transformations. They use their digital literacy skills to creatively use combinations of transformations to design a logo with dynamic geometric software. Spatial learning is communicated through a digital folio using multimedia.</p>	<p>Duration: 10 weeks</p> <p>Realistic and engaging contexts support students to make predictions, test ideas and evaluate options when solving practical problems. In this unit students use mathematical modelling to take action when planning their graduation dinner event.</p> <p>In the first phase of this unit, students draw on multiplicative thinking from Unit 1 and fractional knowledge from Units 2 and 3 to explore finding a familiar fraction, decimal or percentage of a quantity. They make links between percentages and their decimal equivalents, e.g. 30% discount is equivalent to 0.3, which can be calculated by dividing the amount by 10 and multiplying the result by 3, and explore calculating fractions of quantities, e.g. recognising $\frac{2}{3}$ can be calculated by dividing the quantity by 3 and multiplying the result by 2. Students then apply this knowledge, as critical and creative thinkers, to consider the costing of their graduation dinner. Students use the mathematical modelling process to work systematically to review menu options that consider dietary requirements and apply their knowledge of rational numbers (fractions and decimals) and percentages to determine potential costs. Digital tools such as calculators and spreadsheets may support students to record their calculations. Students use estimation, rounding and calculation strategies to formulate possible solutions for catering for the event for the Year 6 cohort and to consider the reasonableness of results. Students write a proposal determining menu options and a possible ticket price that meets a specific budget for the graduation dinner.</p> <p>In the second phase of this unit, students take action to plan a travel itinerary for the invited guests for their graduation dinner. They create a schedule (timetable) for the graduation dinner based on their duration calculations, and researched travel times for invited guests (estimations are calculated by using a digital mapping tool). Students advise the guests on their expected travel times and suggested arrival times, so they do not arrive late for the event. Each guest is provided with a personalised timetable for the evening.</p>

Where there is one assessment item within a unit, the corresponding achievement standard aspect/s is indicated in **blue**.

Where there is a second assessment item within a unit, the corresponding achievement standard aspect/s is indicated in **yellow**.

	Unit 1 — Discovering rules and patterns		Unit 2 — Creative connections		Unit 3 — Exploring possibilities		Unit 4 — Taking action to plan a party	
	Assessment 1 — Project: Involving computational thinking	Term/week	Assessment 2 — Supervised assessment	Term/week	Assessment 4 — Project: Probability experiments and simulation	Term/week	Assessment 6 — Project: Mathematical modelling	Term/week
Assessment	<p>Description: Through an investigation folio, a collection of responses from practical investigations is collated. The investigation folio shows students' proficiency when:</p> <ul style="list-style-type: none"> • using the properties of prime, composite and square numbers to solve problems where they create visually growing patterns • identifying and explaining rules used to create growing patterns • finding unknown values in numerical equations involving combinations of arithmetic operations • using computational thinking skills with function machines to model operations • creating and using algorithms to generate sets of numbers, using a rule with function machines • using the formula for the area of a rectangle to solve problems. <p>Technique: Project Mode: Written (including diagrams, function machines, area representations) Conditions:</p> <ul style="list-style-type: none"> • issued in week 4 and completed over multiple lessons by end of week 8 	Term 1 Week 8	<p>Description: Students answer short response questions focusing on their understanding and fluency when:</p> <ul style="list-style-type: none"> • using integers to represent points on a number line and in the Cartesian plane • locating ordered pairs in any one of the four quadrants on the Cartesian plane • using all four operations with decimals and connecting decimal representations of measurements to the metric system • converting between common units of length, mass and capacity. <p>Technique: Supervised assessment Mode: Written Conditions:</p> <ul style="list-style-type: none"> • up to 60 minutes, plus 5 minutes perusal and/or planning time • may be completed over multiple lessons or broken into components in week 4 	Term 2 Week 4	<p>Description: Students plan and conduct multiple repeated chance experiments using digital tools, to run simulations and collect data. They communicate their findings in an investigation report. Students demonstrate all four proficiencies when:</p> <ul style="list-style-type: none"> • assigning probabilities using common fractions, decimal and percentages • ordering common fractions, giving reasons • adding and subtracting fractions with related denominators • generating and recording the outcomes from many trials of a chance experiment • comparing observed frequencies to the expected frequencies of the outcomes of chance experiments. <p>Technique: Project Mode: Written and practical (conducting chance experiments) Conditions:</p> <ul style="list-style-type: none"> • completed over multiple lessons in week 5 • practical responses are observed by the teacher 	Term 3 Week 5	<p>Part A Description: Students use mathematical modelling to create a proposal of the best menu options that meets a specific budget for the graduation dinner. Students demonstrate all four proficiencies when:</p> <ul style="list-style-type: none"> • using mathematical modelling to solve financial and other practical problems involving percentages and rational numbers • formulating and solving the problem, involving finding a fraction, decimal or percentage of a quantity • using estimation to find approximate solutions to problems involving rational numbers and percentages • justifying choices. <p>Part B Description: In this task students plan personalised travel itineraries and timetables for invited guests. They consider start and finish times and duration of events. Students provide their invited guests with a personalised timetable for the evening.</p> <p>Technique: Project Mode: Written Conditions:</p> <ul style="list-style-type: none"> • issued in week 5 and completed over multiple lessons by end of week 7 • written responses up to 400 words 	Term 4 Week 7

Unit 1 — Discovering rules and patterns		Unit 2 — Creative connections		Unit 3 — Exploring possibilities		Unit 4 — Taking action to plan a party	
Assessment		<p>Assessment 3 — Project: Statistical investigations</p> <p>Description: Through a series of statistical investigations, students record responses to stimulus and questions in a learning journal, e.g. data representations and visualisations, written descriptions, to demonstrate their proficiencies when:</p> <ul style="list-style-type: none"> • comparing distributions of discrete and continuous numerical and ordinal categorical data sets • critiquing arguments presented in the media based on statistics • planning and conducting a statistical investigation connected to the Science learning area on how the growth and survival of plants is affected by changing the physical conditions. <p>Technique: Project Mode: Written (using multimedia where appropriate) Conditions:</p> <ul style="list-style-type: none"> • issued in week 5 and completed over multiple lessons by end of week 9 • written responses up to 400 words 	Term/ week	<p>Assessment 5 — Project</p> <p>Description: Students keep a digital investigation folio, e.g. photographs/diagrams, spatial representations with number sentences, logo design, in response to a series of spatial investigations. The digital folio shows samples of students' learning focusing on their understanding and fluency when:</p> <ul style="list-style-type: none"> • identifying the parallel cross-section for right prisms from hands-on investigations involving slicing models at different angles • using angle properties to create spatial representations and find unknown angles • creating tessellating patterns in logo designs using combinations of transformations. <p>Technique: Project Mode: Written (using digital tools e.g. dynamic geometric software and photographs with annotations) Conditions:</p> <ul style="list-style-type: none"> • issued in week 6 and completed over multiple lessons by end of week 10 	Term/ week		
				Term 2 Week 9		Term 3 Week 10	

	Unit 1 — Discovering rules and patterns	Unit 2 — Creative connections	Unit 3 — Exploring possibilities	Unit 4 — Taking action to plan a party
Achievement standard	<p>By the end of Year 6, students use integers to represent points on a number line and in the Cartesian plane. They solve problems using the properties of prime, composite and square numbers. Students order common fractions, giving reasons, and add and subtract fractions with related denominators. They use all 4 operations with decimals and connect decimal representations of measurements to the metric system. Students solve problems involving finding a fraction, decimal or percentage of a quantity and use estimation to find approximate solutions to problems involving rational numbers and percentages. They use mathematical modelling to solve financial and other practical problems involving percentages and rational numbers, formulating and solving the problem, and justifying choices. Students find unknown values in numerical equations involving combinations of arithmetic operations. They identify and explain rules used to create growing patterns. Students create and use algorithms to generate sets of numbers, using a rule.</p> <p>They interpret and use timetables. Students convert between common units of length, mass and capacity. They use the formula for the area of a rectangle and angle properties to solve problems. Students identify the parallel cross-section for right prisms. They create tessellating patterns using combinations of transformations. Students locate an ordered pair in any one of the 4 quadrants on the Cartesian plane.</p> <p>They compare distributions of discrete and continuous numerical and ordinal categorical data sets as part of their statistical investigations, using digital tools. Students critique arguments presented in the media based on statistics. They assign probabilities using common fractions, decimal and percentages. Students conduct simulations using digital tools, to generate and record the outcomes from many trials of a chance experiment. They compare observed frequencies to the expected frequencies of the outcomes of chance experiments.</p>	<p>By the end of Year 6, students use integers to represent points on a number line and in the Cartesian plane.
