1 Course overview

1.1 Introduction

1.1.1 Rationale

Technology has been an integral part of society for as long as humans have had the desire to create products to improve their quality of life. In an increasingly technological and complex world, it is important to develop the knowledge, understanding and skills associated with traditional and contemporary tools and materials used by Australian manufacturing industries to create products.

The furnishing manufacturing industry transforms raw materials into products wanted by society. This adds value for both enterprises and consumers. Australia, as one of the most developed economies in the world, has strong manufacturing industries that provide employment for many people.

The Furnishing Skills subject focuses on the underpinning industry practices and production processes required to manufacture furnishing products with high aesthetic qualities. The furnishing industry comprises a wide range of fields, including soft furnishing, commercial and household furniture-making, cabinet-making and upholstering. Furnishing products can be manufactured from a range of materials such as textiles, timber, polymers, composites and metals. This subject provides a unique opportunity for students to experience the challenge and personal satisfaction of undertaking practical work while developing beneficial vocational and life skills.

The subject includes two core topics — ‘Industry practices’ and ‘Production processes’. Industry practices are used by manufacturing enterprises to manage the manufacturing of products from raw materials. Production processes combine the production skills and procedures required to create products. Students explore the knowledge, understanding and skills of the core topics through selected industry-based electives in response to local needs, available resources and teacher expertise.

Through both individual and collaborative learning experiences, students learn to meet customer expectations of product quality at a specific price and time. The majority of learning is done through manufacturing tasks that relate to business and industry, and that promote adaptable, competent, self-motivated and safe individuals who can work with colleagues to solve problems and complete practical work.

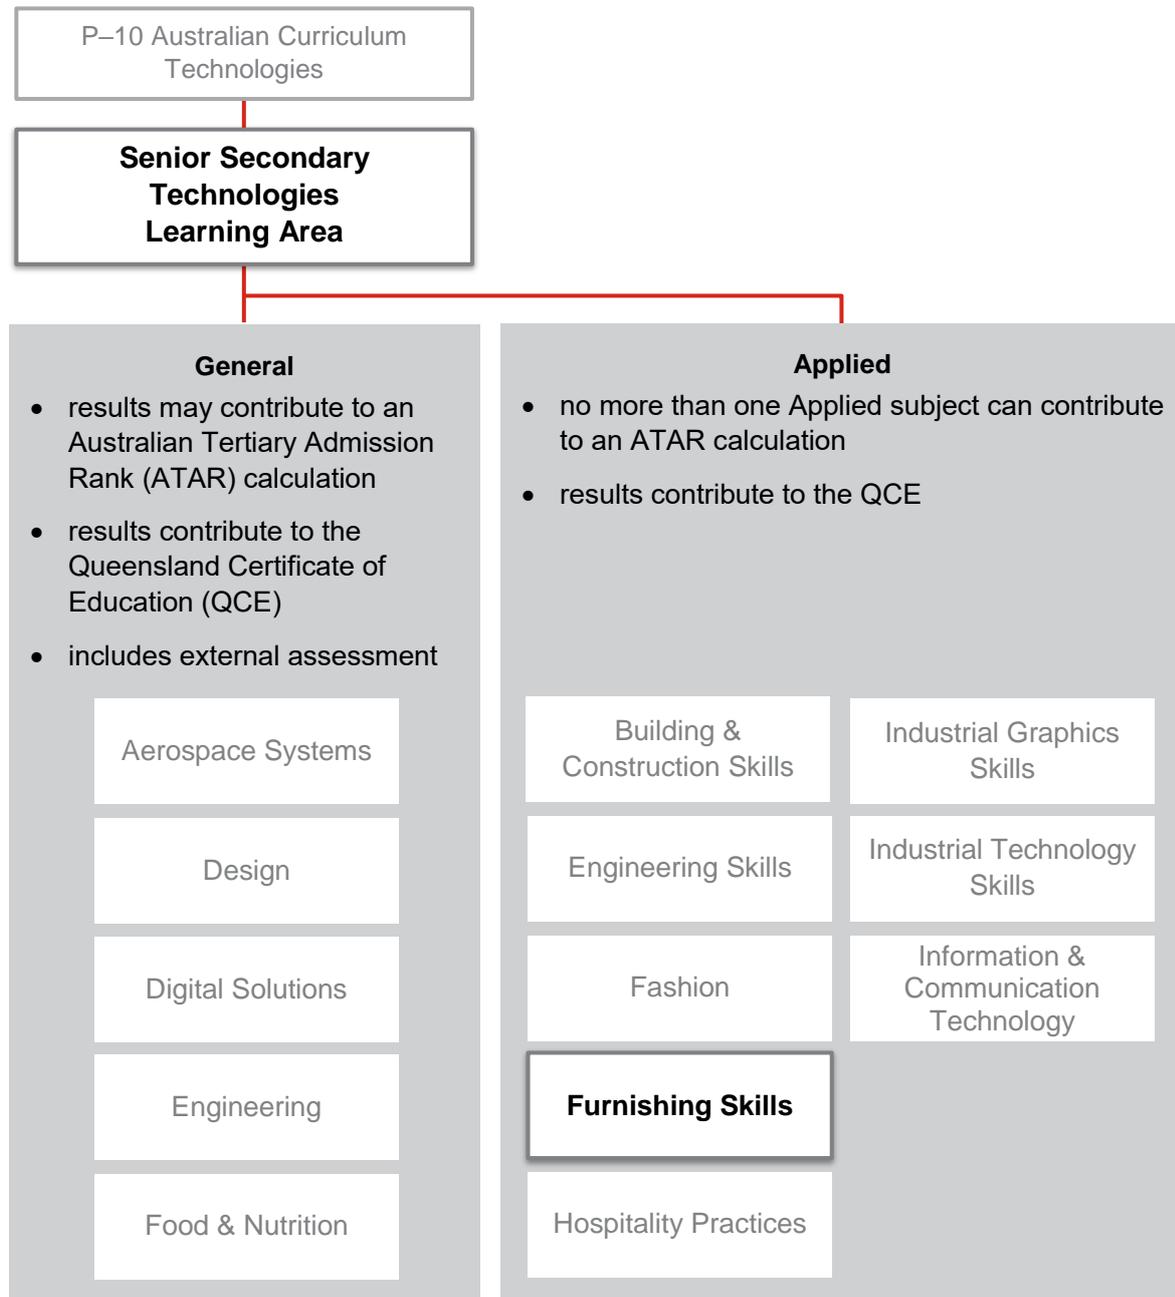

By doing manufacturing tasks, students develop transferable skills relevant to a range of industry-based electives and future employment opportunities. They understand industry practices, interpret specifications, including information and drawings, demonstrate and apply safe practical production processes with hand/power tools and equipment, communicate using oral, written and graphical modes, organise, calculate and plan production processes and evaluate the products they create using predefined specifications.

Pathways

A course of study in Furnishing Skills can establish a basis for further education and employment in the furnishing industry. With additional training and experience, potential employment opportunities may be found in furnishing trades as, for example, a furniture-maker, wood machinist, cabinet-maker, polisher, shopfitter, upholsterer, furniture restorer, picture framer, floor finisher or glazier.

1.1.2 Learning area structure

Figure 1: Summary of subjects offered in the Technologies learning area

1.2 Teaching and learning

1.2.1 Dimensions and objectives

The dimensions are the salient properties or characteristics of distinctive learning for this subject. The objectives describe what students should know and be able to do by the end of the course of study.

Progress in a particular dimension may depend on the knowledge, understanding and skills developed in other dimensions. Learning through each of the dimensions increases in complexity to allow for greater independence for learners over a four-unit course of study.

The standards have a direct relationship with the objectives, and are described in the same dimensions as the objectives. Schools assess how well students have achieved all of the objectives using the standards.

The dimensions for a course of study in this subject are:

- Dimension 1: Knowing and understanding
- Dimension 2: Analysing and applying
- Dimension 3: Producing and evaluating.

Dimension 1: Knowing and understanding

Knowing and understanding refers to being familiar with the concepts and ideas used in manufacturing tasks within industry-based electives. This involves retrieving relevant knowledge and practical skills from memory, constructing meaning from instructional messages, and recognising, interpreting and demonstrating manufacturing tasks.

Objectives

By the conclusion of the course of study, students should:

- describe industry practices in manufacturing tasks
- demonstrate fundamental production skills
- interpret drawings and technical information.

When students describe, they use industry terminology and provide examples from manufacturing tasks to help clarify the meaning of industry practice concepts and ideas. These concepts and ideas include manufacturing enterprises and occupations, safety, personal and interpersonal skills in manufacturing workplaces, customer expectations of quality and impacts on production processes.

When students demonstrate, they reproduce fundamental production skills safely and correctly. These skills may include the operation of hand/power tools and machinery, maintenance of tools and equipment, measuring techniques, safe work practices and general housekeeping.

When students interpret, they determine the meaning and essential features of drawings and industry-specific technical information to complete manufacturing tasks. Drawings and technical information together are defined as specifications.

Dimension 2: Analysing and applying

Analysing refers to breaking down information into its constituent parts and determining how the parts relate to each other and to an overall structure or purpose within manufacturing tasks. This may involve differentiating, organising and/or attributing. Applying refers to carrying out or using a procedure in a given situation.

Objectives

By the conclusion of the course of study, students should:

- analyse manufacturing tasks to organise materials and resources
- select and apply production skills and procedures in manufacturing tasks
- use visual representations and language conventions and features to communicate particular purposes.

When students analyse and organise, they ascertain and examine constituent parts of industry practices and production processes to establish the work roles and skills, quality, safety, materials, quantities, tools and related resources required to complete manufacturing tasks. This may include calculating quantities and costs, and identifying materials, particular tools, fasteners and procedures required to manipulate the materials used in the manufacturing task.

When students apply, they demonstrate their understanding by selecting and using particular industry production skills and procedures in preference to others when completing manufacturing tasks. Examples include selecting and following safe operating procedures, selecting, setting up and using hand/power tools and machinery for a purpose and selecting and using production procedures such as marking out, cutting, joining and finishing.

When students use visual representations and language conventions and features, they convey industry-specific knowledge and/or understanding for particular purposes. Visual representations include photographs, sketches, drawings, diagrams, graphs and symbols. Language conventions and features include industry-specific vocabulary, grammar, spelling, punctuation, text types and structures in spoken and written modes. Communicating for particular purposes may include pictorial sketches, working drawings, verbal descriptions of production procedures, material lists, risk assessments, safe operating procedures and forms.

Dimension 3: Producing and evaluating

Producing refers to planning production processes, then creating functional products that meet predefined specifications. Evaluating refers to the reflection on industry practices, production process and products to consider ways to improve future manufacturing tasks.

Objectives

By the conclusion of the course of study, students should:

- plan and adapt production processes
- create products from specifications
- evaluate industry practices, production processes and products, and make recommendations.

When students plan, they devise a series of actions that allows them to manufacture a product. Students consider the predefined specifications, production skills, selection and sequence of procedures and tools, materials, consumables, safety (including risk assessment), management of time and cost and expectations of quality. When students adapt, they consider the feasibility, efficiency and modification of proposed production skills and procedures.

When students create, they synthesise knowledge and skills in industry practices and production processes to manufacture a completed functional product to predefined specifications. These specifications may include working drawings, sketches, templates and technical information. They make decisions about how to combine a range of production skills and procedures and actively engage in monitoring and modifying procedures as a result of issues arising during the production process.

When students evaluate, they test and check industry practices, production processes and their own created functional products in terms of meeting specifications. When students make recommendations, they consider alternatives and suggest ways to improve production processes and products.

1.2.2 Underpinning factors

There are five factors that underpin and are essential for defining the distinctive nature of Applied syllabuses:

- applied learning
- community connections
- core skills for work
- literacy
- numeracy.

These factors, build on the general capabilities found in the P–10 Australian Curriculum. They overlap and interact, are derived from current education, industry and community expectations, and inform and shape Furnishing Skills.

All Applied syllabuses cover all of the underpinning factors in some way, though coverage may vary from syllabus to syllabus. Students should be provided with a variety of opportunities to learn through and about the five underpinning factors across the four-unit course of study.

Applied learning and community connections emphasise the importance of applying learning in workplace and community situations. Applied learning is an approach to contextualised learning; community connections provide contexts for learning, acquiring and applying knowledge, understanding and skills. Core skills for work, literacy and numeracy, however, contain identifiable knowledge and skills which can be directly assessed. The relevant knowledge and skills for these three factors are contained in the course dimensions and objectives for Furnishing Skills.

Applied learning

Applied learning is the acquisition and application of knowledge, understanding and skills in real-world or lifelike contexts. Contexts should be authentic and may encompass workplace, industry and community situations.

Applied learning values knowledge — including subject knowledge, skills, techniques and procedures — and emphasises learning through doing. It includes both theory and the application of theory, connecting subject knowledge and understanding with the development of practical skills.

Applied learning:

- links theory and practice
- integrates knowledge and skills in real-world and/or lifelike contexts

- encourages students to work individually and in teams to complete tasks and solve problems
- enables students to develop new learnings and transfer their knowledge, understanding and skills to a range of contexts
- uses assessment that is authentic and reflects the content and contexts.

Community connections

Community connections build students' awareness and understanding of life beyond school through authentic, real-world interactions. This understanding supports the transition from school to participation in, and contribution to, community, industry, work and not-for-profit organisations. 'Community' includes the school community and the wider community beyond the school, including virtual communities.

Valuing a sense of community encourages responsible citizenship. Connecting with community seeks to deepen students' knowledge and understanding of the world around them and provide them with the knowledge, understanding, skills and dispositions relevant to community, industry and workplace contexts. It is through these interactions that students develop as active and informed citizens.

Schools plan connections with community as part of their teaching and learning programs to connect classroom experience with the world outside the classroom. It is a mutual or reciprocal arrangement encompassing access to relevant experience and expertise. The learning can be based in community settings, including workplaces, and/or in the school setting, including the classroom.

Community connections can occur through formal arrangements or more informal interactions. Opportunities for community connections include:

- visiting a furnishing business or community organisation or agency to build students' awareness and understanding of the range of opportunities in the furnishing industry beyond school
- organising an event for the school or local community
- working with community groups in a range of activities
- providing a service for the local community
- attending industry expos and career 'taster' days
- participating in work-shadowing of an apprentice or tradesperson who works in the furnishing industry
- gaining work experience in the furnishing industry
- participating in community service projects or engaging in service learning
- interacting with visitors to the school, such as community representatives, furnishing industry experts, employers, employees and the self-employed
- internet, phone or video conferencing with other school communities.

Core skills for work

In August 2013, the Australian Government released the *Core Skills for Work Developmental Framework (CSfW)*.¹ The *CSfW* describes a set of knowledge, understanding and non-technical skills that underpin successful participation in work.² These skills are often referred to as generic or employability skills. They contribute to work performance in combination with technical skills, discipline-specific skills, and core language, literacy and numeracy skills.

The *CSfW* describes performance in ten skill areas grouped under three skill clusters, shown in the table below. These skills can be embedded, taught and assessed across Furnishing Skills. Relevant aspects of core skills for work are assessed, as described in the standards.

Table 1: Core skills for work skill clusters and skill areas

	Skill cluster 1: Navigate the world of work	Skill cluster 2: Interacting with others	Skill cluster 3: Getting the work done
Skill areas	<ul style="list-style-type: none">• Manage career and work life• Work with roles, rights and protocols	<ul style="list-style-type: none">• Communicate for work• Connect and work with others• Recognise and utilise diverse perspectives	<ul style="list-style-type: none">• Plan and organise• Make decisions• Identify and solve problems• Create and innovate• Work in a digital world

Literacy in Furnishing Skills

The information and ideas that make up Furnishing Skills are communicated in language and texts. Literacy is the set of knowledge and skills about language and texts that is essential for understanding and conveying this content.

Each Applied syllabus has its own specific content and ways to convey and present this content. Ongoing systematic teaching and learning focused on the literacy knowledge and skills specific to Furnishing Skills is essential for student achievement.

Students need to learn and use the knowledge and skills of reading, viewing and listening to understand and learn the content of Furnishing Skills. Students need to learn and use the knowledge and skills of writing, composing and speaking to convey the Furnishing Skills content they have learnt.

In teaching and learning in Furnishing Skills, students learn a variety of strategies to understand, use, analyse and evaluate ideas and information conveyed in language and texts.

To understand and use Furnishing Skills content, teaching and learning strategies include:

- breaking the language code to make meaning of Furnishing Skills language and texts
- comprehending language and texts to make literal and inferred meanings about Furnishing Skills content
- using Furnishing Skills ideas and information in classroom, real-world and/or lifelike contexts to progress their own learning.

To analyse and evaluate Furnishing Skills content, teaching and learning strategies include:

- making conclusions about the purpose and audience of Furnishing Skills language and texts
- analysing the ways language is used to convey ideas and information in Furnishing Skills texts

¹ More information about the *Core Skills for Work Developmental Framework* is available at <https://docs.education.gov.au/node/37095>

² The term 'work' is used in the broadest sense: activity that is directed at a specific purpose, which may or may not be for remuneration or gain.

- transforming language and texts to convey Furnishing Skills ideas and information in particular ways to suit audience and purpose.

Relevant aspects of literacy knowledge and skills are assessed, as described in the standards.

Numeracy in Furnishing Skills

Numeracy is about using mathematics to make sense of the world and applying mathematics in a context for a social purpose.

Numeracy encompasses the knowledge, skills, behaviours and dispositions that students need to use mathematics in a wide range of situations. Numeracy involves students recognising and understanding the role of mathematics in the world and having the dispositions and capacities to use mathematical knowledge and skills purposefully.³

Although much of the explicit teaching of numeracy skills occurs in Mathematics, being numerate involves using mathematical skills across the curriculum. Therefore, a commitment to numeracy development is an essential component of teaching and learning across the curriculum and a responsibility for all teachers.

To understand and use Furnishing Skills content, teaching and learning strategies include:

- identifying the specific mathematical information
- providing learning experiences and opportunities that support the application of students' general mathematical knowledge and problem-solving processes
- communicating and representing the language of numeracy in teaching, as appropriate.

Relevant aspects of numeracy knowledge and skills are assessed, as described in the standards.

1.2.3 Planning a course of study

Furnishing Skills is a four-unit course of study.

Units 1 and 2 of the course are designed to allow students to begin their engagement with the course content, i.e. the knowledge, understanding and skills of the subject. Course content, learning experiences and assessment increase in complexity across the four units as students develop greater independence as learners.

Units 3 and 4 consolidate student learning.

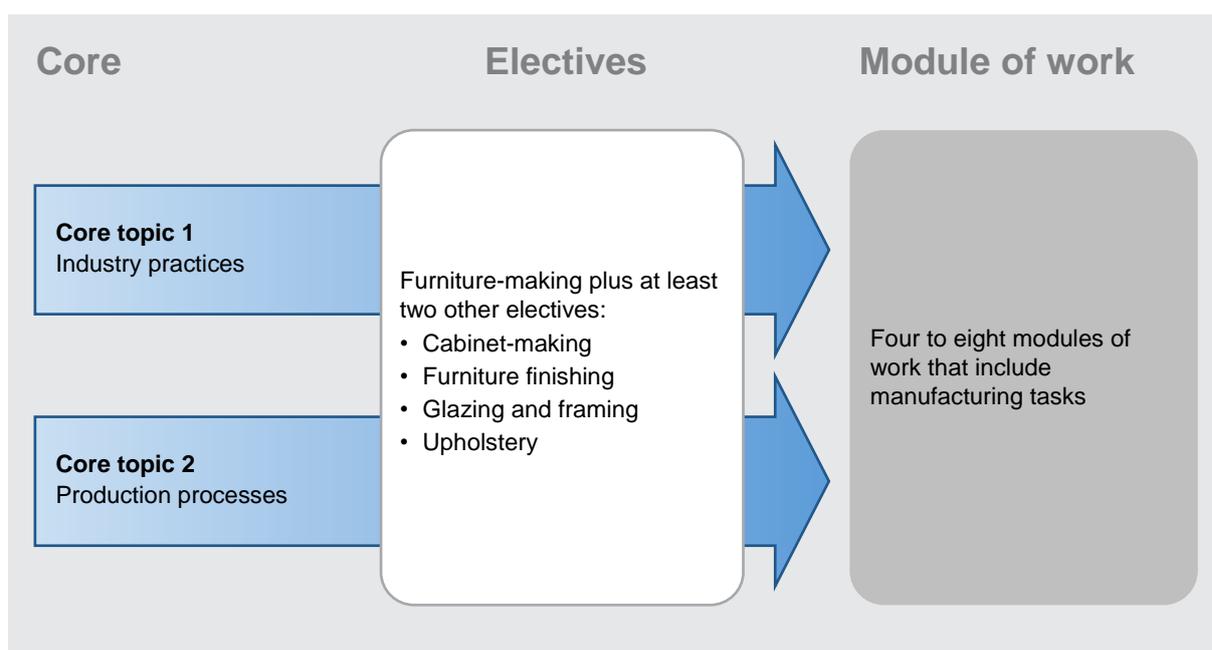

The minimum number of hours of timetabled school time, including assessment, for a course of study developed from this Applied syllabus is 55 hours per unit. A course of study will usually be completed over four units (220 hours).

A course of study for Furnishing Skills includes:

- core topics — 'Industry practices' and 'Production processes' — and their associated concepts and ideas integrated into modules of work across Units 1 and 2, and further developed in Units 3 and 4
- electives — furniture-making plus at least two other electives. The electives included in Units 3 and 4 must have been introduced in Units 1 or 2
- modules of work — four to eight modules of work across the four-unit course of study. Each module of work is based on one or more elective/s and related manufacturing tasks (see Manufacturing tasks).

³ ACARA, General Capabilities, Numeracy, www.australiancurriculum.edu.au/GeneralCapabilities/Numeracy/Introduction/Introduction

Figure 2: A course of study: the relationship between core, electives and modules of work

1.2.4 Developing a module of work

A module of work is developed from the elective/s and outlines the knowledge, understanding and skills, learning experiences and assessment that will be effective in implementing the objectives of the syllabus.

A module of work in Furnishing Skills consists of:

- one or more electives (multiple electives in a single module of work should be integrated, e.g. furniture-making and upholstery)
- one or more manufacturing tasks related to the chosen elective/s
- in-depth coverage of both core topics ('Industry practices' and 'Production processes') and associated concepts and ideas (not all core concepts and ideas need to be evident in each module of work)
- opportunities for teaching, learning and assessment of the objectives of Knowing and understanding, Analysing and applying, and Producing and evaluating.

1.2.5 Manufacturing tasks

Manufacturing tasks in this syllabus are defined as industry-related learning experiences through which students may demonstrate Knowing and understanding, Analysing and applying and Producing and evaluating. Manufacturing tasks range from skill exercises focused on specific production procedures (e.g. cutting and fitting a timber joint) to the combination of 'Industry practices' and 'Production processes' needed to manufacture completed functional products to specifications (e.g. creating a stained timber coffee table with a glass top). Manufacturing tasks are chosen from the electives, which are drawn from the common furnishing trade qualifications. Examples of manufacturing tasks are provided in each of the electives to assist with module of work planning (see Electives).

1.2.6 Aboriginal perspectives and Torres Strait Islander perspectives

The Queensland Government has a vision that Aboriginal and Torres Strait Islander Queenslanders have their cultures affirmed, heritage sustained and the same prospects for health, prosperity and quality of life as other Queenslanders. The QCAA is committed to helping achieve this vision, and encourages teachers to include Aboriginal perspectives and Torres Strait Islander perspectives in the curriculum.

The QCAA recognises Aboriginal peoples and Torres Strait Islander peoples, their traditions, histories and experiences from before European settlement and colonisation to the present time. Opportunities exist in Furnishing Skills to encourage engagement with Aboriginal peoples and Torres Strait Islander peoples and strengthen students' appreciation and understanding of:

- frameworks of knowledge and ways of learning
- contexts in which Aboriginal peoples and Torres Strait Islander peoples live
- contributions to Australian society and cultures.

In Furnishing Skills, teachers and students should have opportunities to build cultural competence by understanding, communicating and effectively interacting with people across all cultures, but particularly Aboriginal cultures and Torres Strait Islander cultures. This cultural competence is achieved through honest engagement, building trust and working with local community members.

There is an opportunity for students to:

- appreciate that Aboriginal peoples and Torres Strait Islander peoples have a longstanding tradition of developing and using a range of technologies in a sustainable way
- understand that Aboriginal peoples and Torres Strait Islander peoples develop technologies that support sustainable practices for local conditions
- explore how Aboriginal peoples' and Torres Strait Islander peoples' capacity for innovation is evident in the incorporation of a range of introduced technologies within existing practices in ways that purposefully build or maintain cultural, community and economic capacity.

Guidelines about Aboriginal perspectives and Torres Strait Islander perspectives and resources for teaching are available at www.qcaa.qld.edu.au/k-12-policies/aboriginal-torres-strait-islander-perspectives.

2 Subject matter

2.1 Core

The core is what all students who undertake a four-unit course of study in this subject will have the opportunity to learn. The core of this subject consists of two topics:

- industry practices
- production processes.

Both core topics include concepts and ideas that provide a focus for each topic and the minimum knowledge, understanding and skills that students would be expected to explore in the course of study.

The core topics are interrelated and are not intended to be treated in isolation. Concepts and ideas are progressively developed across the course of study through the associated knowledge, understanding and skills. Further knowledge, understanding and skills may arise in a module of work from engagement with electives and specific manufacturing tasks. The school decides the coverage and depth to which the knowledge, understanding and skills is explored in each module of work.

The core topics are presented in tables below.

2.1.1 Core topic 1: Industry practices

Focus	
<p>Industry practices are used to effectively and efficiently manage manufacturing enterprises, workplace health and safety, employee personal and interpersonal skills and customer expectations to safely change raw materials into products wanted by society and which add value for both enterprises and consumers.</p>	
Concepts and ideas	Knowledge, understanding and skills
<p>Manufacturing enterprises Manufacturing enterprises are important to the economy of Australia and employ a broad range of people in many different occupations (C1.1).</p>	<ul style="list-style-type: none"> • overview of furnishing enterprises and their contribution to the economy, e.g. types of enterprises, successful businesses, technology use, cost structure and industry culture (including sustainable practices) • organisational structure of furnishing workplaces, e.g. human resources, safe and cooperative work environments, job descriptions, linking skills to employment options, receipt and storage of raw material, maintenance, design, quality and testing, transport, warehousing, marketing, trade and professional associations • career options and pathways, e.g. semi-skilled and trade occupations (wood machinist, cabinet-maker, polisher, shopfitter, upholsterer, furniture restorer, picture framer, floor finisher and glazier) and the differences in skill levels for modern manufacturing practices
<p>Workplace health and safety Workplace health and safety legislation, rules and procedures must be followed in manufacturing industry workplaces (C1.2).</p>	<ul style="list-style-type: none"> • employer and employee responsibilities, rights and obligations under the <i>Work Health and Safety Act 2011</i> • industry-specific requirements, e.g. codes of practice/policies training, machine training/licensing and standard operating procedures • risk assessments to identify hazards, e.g.

	<ul style="list-style-type: none"> - hand/power tools, plant and fixed machinery - materials - manual handling - environment • safe working practices and procedures, e.g. <ul style="list-style-type: none"> - hierarchy of hazard control pertaining to any workplace activity, which may include tool selection, personal protective equipment, manual handling techniques, ongoing monitoring and review, dust, fumes, waste, noise, movement, barriers, signage and fire prevention
<p>Personal and interpersonal skills Personal and interpersonal skills, including teamwork and communication skills, are essential for effective participation in manufacturing workplaces (C1.3).</p>	<ul style="list-style-type: none"> • work-readiness skills, e.g. punctuality, ethical behaviour, diligence, respect for authority, demonstrating initiative (such as using time effectively and notifying unsafe practices) • teamwork in the workplace, e.g. clear expectations of work roles, working cooperatively with others, being involved in group discussions, working with people from diverse social, cultural and ethnic backgrounds and with varying physical and mental abilities • workplace communication using industry-specific terminology including written, graphical, verbal and non-verbal, e.g. <ul style="list-style-type: none"> - written, such as safety rules, work instructions, timesheets, forms (such as accident reports), safe operating procedures and job applications - sketching, such as two-dimension and three-dimension graphical views - verbal and non-verbal instructions, such as practical demonstration of skills and processes, verbal task instructions and hand signals
<p>Product quality The quality of products depends on customer expectation of value, which affects industry production processes (C1.4).</p>	<ul style="list-style-type: none"> • quality standards of products are derived from customer expectations of value based on factors such as needs, trends, budget, product life and competition, e.g. using pre-fabricated products (flat packs) or one-off designed furniture and kitchens built to price and quality depending on customer expectations • products are manufactured to predefined specifications that detail the expected quality standards of the final product, e.g. materials, fits, finish, joints and longevity • manufacturing enterprises make decisions about production processes that affect product quality based on a range of factors, e.g. <ul style="list-style-type: none"> - specifications (drawings and technical information) - customer expectations - business practices - wholesale and retail costs - available production time - available resources (human, materials, plant and equipment) - waste - recycling - government regulations

2.1.2 Core topic 2: Production processes

Focus	
Production processes combine production skills and procedures to safely manufacture products to specifications using tools and materials.	
Concepts and ideas	Knowledge, understanding and skills
<p>Specifications Specifications are communicated through industry-specific drawings and technical information (C2.1).</p>	<ul style="list-style-type: none"> • interpretation of sketches and technical drawings, e.g. <ul style="list-style-type: none"> – sketches, e.g. thumbnail and diagram – technical drawings, e.g. orthogonal projections, pictorial drawings, exploded views and set-out – dimensions, symbols/annotation and scale • technical information accessed from charts, manuals, templates, tables and books, e.g. set-up procedures, speeds and feeds, drill sizes for fixings and fittings, schedules, standard operating procedures and safety data sheets
<p>Tools Tools have specific functions and are selected and safely operated for particular procedures (C2.2). (See risk management.)</p>	<ul style="list-style-type: none"> • identification, safety and maintenance of tools and machinery, e.g. <ul style="list-style-type: none"> – tool names and purpose – safe work practices – guards and attachments – tool storage and maintenance – machine settings (tooling/blades/cutter/speed/feed selection) – replacement and disposal – general housekeeping • marking-out procedures and skills using relevant tools, e.g. <ul style="list-style-type: none"> – procedures used to measure, estimate and calculate materials, e.g. length, diameter, thickness, area, percentages and perimeters – skills using measuring/marking-out tools, e.g. tape measure, rule, vernier callipers, square, combination set, bevel, divider, chalk line and marking gauge • cutting procedures and skills using relevant tools, e.g. <ul style="list-style-type: none"> – purposes, limitations and safe methods of cutting a range of materials – skills using hand tools, e.g. holding devices, tenon saw, coping saw, chisel, hammer, mallet and planer – skills using power tools, e.g. jigsaw, drop saw, scroll saw, wall saw, biscuit joiner, mortiser, routing table and edge bander • machining procedures and skills using relevant machinery, e.g. <ul style="list-style-type: none"> – purposes, limitations and safe methods of machining a range of materials – skills using fixed machinery, e.g. bandsaw, CNC tools and equipment, thicknesser, mortiser, jointer and lathe • assembling procedures and skills using relevant tools and machinery, e.g. <ul style="list-style-type: none"> – purposes, limitations and safe methods of assembling a range of materials and components – skills using hand tools, e.g. clamps, hammers and screwdrivers – skills using power tools, e.g. drills and pneumatic tools • finishing procedures and skills using relevant tools and machinery, e.g. <ul style="list-style-type: none"> – purposes, limitations and safe methods of finishing a range of materials – skills using hand tools, e.g. sandpaper, rasp, file, brush, roller, holding devices and spray gun – skills using power tools, e.g. belt and orbital sander – skills using fixed machinery, e.g. drum sander, scrolling equipment,

	bobbin sander and compressor
<p>Materials Materials are selected and safely manipulated based on industry-specific applications (C2.3).</p>	<ul style="list-style-type: none"> • types of materials, e.g. polymers, composites (including manufacture boards), metals, timbers, timber sources (recycled, plantation, native) and recycled products • properties of materials, e.g. strength, colour, durability, grain, hardness, density and mass • sections, shapes and sizes of products, e.g. dressed timber, sheet sizes, mouldings and laminated • logistics, e.g. suppliers, ordering, storage, transportation and environmental management • industry applications and manipulation procedures, e.g. cutting, joining, machining, material optimisation, tool selection, surface preparation and clean-up • consumables, e.g. adhesives, fixings and fasteners, paints, solvents and sealants • safety data sheets

2.1.3 Risk management

Schools will need to appropriately manage the risks associated with tools and materials used in this course of study.

Risk management processes will include safe operating procedures, record-keeping of maintenance and risk assessments for high-risk equipment.

Further information to assist schools with health and safety is available on the Queensland Government's Department of Education and Training website:

<http://education.qld.gov.au/health/safety/index.html>.

The Department of Education and Training has developed support material to manage risks specific to Industrial Technology and Design (Manual Arts):

<http://education.qld.gov.au/health/safety/managing/industrial-technology-design.html>.

2.2 Electives

The electives in this subject are based on furnishing industry specialisations that require tradespeople with specific knowledge, understanding and skills when using tools and materials to create or maintain products. Each elective predominantly relates to a common current furnishing trade qualification described in the industry training packages at:

<https://training.gov.au/Home/Tga>.

The choice of electives is dependent on:

- dimensions, objectives and core topics to be explored
- the interests of the student cohort
- the expertise of teachers
- available facilities and resources.

The following tables provide a description of electives with examples of school-based manufacturing tasks to assist schools with module of work planning. The information provided is a guide for teachers and is not meant to be definitive. The examples are not meant to be exhaustive.

1.1.1 Cabinet-making

Description
Cabinet-making refers to making or repairing kitchen and bathroom cabinets, wardrobes, office fit-outs and shop fittings. Associated processes include wood and composites machining, which involves using a range of machinery to cut, shape and mould wood into functional forms to be used in cabinet-making production processes. Cabinets can be manufactured from a range of materials, e.g. solid timber, manufactured board, composite material or sheet metal.
Possible manufacturing tasks
Students could be involved in manufacturing tasks such as: <ul style="list-style-type: none">• interpreting technical drawings, e.g. orthogonal projections, pictorial drawings and exploded views, in order to prepare cutting lists and calculate quantities and costs of sheet materials• identifying, selecting and preparing timber, composites, sheet metal and timber-based materials for cabinet production• using jigs and templates for the production of cabinet components• setting up and controlling computer numerical control (CNC) machines to produce cabinet components from computer-aided drafting (CAD)• measuring, marking out, cutting and shaping timber and manufactured board using saws, planes, power tools and machinery• assembling cabinet components and selecting and installing hardware such as handles, hinges, locks, catches, drawers and shelves• interpreting working drawings, cutting, joining and finishing manufactured board and fitting hardware to produce a flat-pack cabinet such as a vanity, audiovisual cabinet or dart board.

2.2.1 Furniture finishing

Description
Furniture finishing refers to preparing surfaces and applying stains, coatings and finishes to furniture in manufacture or repair. Grinders, sanders, chisels, steel wool, pumice and sandpaper are used for finishing, and materials used can include varnish, shellac, lacquer, stain and paint.
Possible manufacturing tasks
Students could be involved in manufacturing tasks such as: <ul style="list-style-type: none">• testing and deciding on the best method to repair, restore and match stained timber furniture• selecting finishes to suit the material and the product's intended use• interpreting technical information such as safety data sheets to determine appropriate equipment and procedures for using a particular consumable• disassembling furniture, removing surface coatings and damaged or deteriorated parts and using hand stripping tools, solvents and abrasives• repairing damaged components to remove warps, cracks, depressions and imperfections• selecting and mixing ingredients to match an existing required finish• masking and setting up for spray-painting and applying multiple coats of paint using a spray gun• applying a distressed finish to a new piece of furniture• restoring a wooden blanket box.

2.2.2 Furniture-making

Description

Furniture-making refers to making or repairing individual pieces of furniture such as chairs, lounges, tables, dining suites, bedroom suites and dressers. Associated processes include wood and composites machining, which involves using a range of machinery to cut, shape and mould wood into functional forms to be used in furniture-making production processes. Furniture can be manufactured from a range of materials, e.g. timber, polymers, composites and metals.

Possible manufacturing tasks

Students could be involved in manufacturing tasks such as:

- interpreting technical drawings to measure and mark out timber and metal materials
- cutting joints using machines
- cleaning and maintaining work areas, including sharpening hand tools, to ensure a safe working environment
- marking out, cutting and gluing joints and fitting parts together to form sections of furniture
- repairing damaged furniture by disassembling and cleaning components, reproducing broken components, assembling using adhesives and matching and applying finishes
- working in a team to manufacture an outdoor setting from working drawings
- manufacturing a table with a steel base and timber-framed mosaic top.

2.2.3 Glazing and framing

Description

Glazing refers to the cutting, shaping and installation of glass used in windows, doors, mirrors, display cabinets, shower enclosures and walls. This may involve the replacement and removal of residential, commercial and artistic glass. There are three components: cutting glass, bevelling or smoothing edges, and fitting or glazing glass into prepared openings that may be constructed with materials such as timber, aluminium, stainless steel or polymers. Framing involves making frames of all types and sizes by cutting out and assembling mouldings and mounting and displaying decorative items such as paintings, prints, etchings, tapestries and photographs.

Possible manufacturing tasks

Students could be involved in manufacturing tasks such as:

- interpreting drawings or measuring a frame to determine the size of glass required
- measuring objects to be framed to prepare framing materials of an appropriate style, size and cost
- marking out, cutting and joining timber frame mouldings, glass and backing materials and assembling components to mount an item
- cutting glass using a variety of glasscutters and removing excess glass with notched tools or glass pliers
- fitting glass into timber and aluminium window frames using putty, chemical compounds or rubber strips
- repairing glass units such as a fish tank — disassembling and cleaning glass, measuring, marking, cutting and joining replacement glass
- interpreting window plans to construct an aluminium window frame.

2.2.4 Upholstery

Description

Upholstery refers to dismantling and reassembling furniture and selecting, cutting, sewing and fitting fabric and leather upholstery materials. It involves producing loose covers and soft furnishings by sewing, selecting, manufacturing and installing curtains and drapes with required fittings. It uses a range of materials, fixtures and fittings to manufacture soft furnishing accessories. Upholstery includes constructing, installing and repairing interior and exterior blinds and awnings.

Possible manufacturing tasks

Students could be involved in manufacturing tasks such as:

- interpreting product requirements by considering colour, fabric, style and costs of upholstery
- measuring and cutting covering material, joining sections and tacking fabric onto the furniture frame
- repairing upholstered furniture by replacing covers and webbing, and cutting and fitting foam padding and springs
- manufacturing roll-up and pull-down style blinds and awnings and selecting and applying blinds and awning-related hardware and fixings
- cutting single layer fabrics, machine and hand sewing materials for soft furnishings
- re-upholstering a chair
- repairing a marine or auto cover.

3 Assessment

3.1 Assessment — general information

Assessment is an integral part of the teaching and learning process. It is the purposeful, systematic and ongoing collection of information about student learning outlined in the syllabus.

The major purposes of assessment are to:

- promote, assist and improve learning
- inform programs of teaching and learning
- advise students about their own progress to help them achieve as well as they are able
- give information to parents, carers and teachers about the progress and achievements of individual students to help them achieve as well as they are able
- provide comparable exit results in each Applied syllabus which may contribute credit towards a Queensland Certificate of Education (QCE); and may contribute towards Australian Tertiary Admission Rank (ATAR) calculations
- provide information about how well groups of students are achieving for school authorities and the State Minister responsible for Education.

Student responses to assessment opportunities provide a collection of evidence on which judgments about the quality of student learning are made. The quality of student responses is judged against the standards described in the syllabus.

In Applied syllabus, assessment is standards-based. The standards are described for each objective in each of the three dimensions. The standards describe the quality and characteristics of student work across five levels from A to E.

3.1.1 Planning an assessment program

When planning an assessment program over a developmental four-unit course, schools should:

- administer assessment instruments at suitable intervals throughout the course
- provide students with opportunities in Units 1 and 2 to become familiar with the assessment techniques that will be used in Units 3 and 4
- assess all of the dimensions in each unit
- assess each objective at least twice by midway through the course (end of Unit 2) and again by the end of the course (end of Unit 4)
- assess only what the students have had the opportunity to learn, as prescribed in the syllabus and outlined in the study plan.

For a student who studies four units, only assessment evidence from Units 3 and 4 contributes towards decisions at exit.

Further guidance can be found in the QCE and QCIA policy and procedures handbook.

3.1.2 Authentication of student work

Schools and teachers must have strategies in place for ensuring that work submitted for internal summative assessment is the student's own.

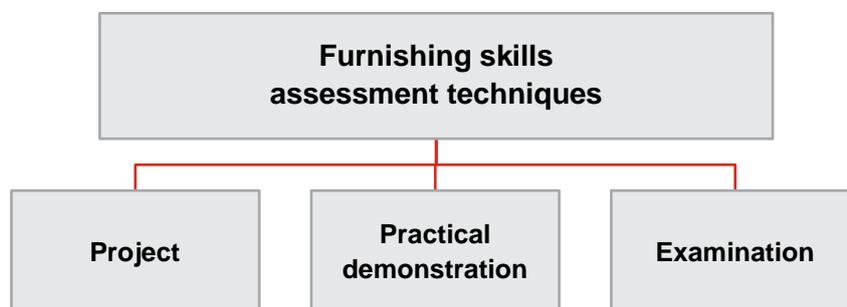

Judgments about student achievement are based on evidence of the demonstration of student knowledge, understanding and skills. Schools ensure responses are validly each student's own work.

Guidance about authentication strategies which includes guidance for drafting, scaffolding and teacher feedback can be found in the QCE and QCIA policy and procedures handbook.

3.2 Assessment techniques

The assessment techniques relevant to this syllabus are identified in the figure below and described in detail within the individual assessment techniques.

Figure 3: Furnishing Skills assessment techniques

Schools design assessment instruments from the assessment techniques relevant to this syllabus. The assessment instruments students respond to in Units 1 and 2 should support those techniques included in Units 3 and 4.

For each assessment instrument, schools develop an instrument-specific standards matrix by selecting the syllabus standards descriptors relevant to the task and the dimension/s being assessed (see Standards matrix).

The matrix is used as a tool for making judgments about the quality of students' responses to the instrument and is developed using the syllabus standards descriptors. Assessment is designed to allow students to demonstrate the range of standards (see Determining an exit result). Teachers give students an instrument-specific standards matrix for each assessment instrument.

Evidence

Evidence includes the student's responses to assessment instruments and the teacher's annotated instrument-specific standards matrixes. Evidence may be direct or indirect. Examples of direct evidence include student responses to assessment instruments or digital recordings of student performances. Examples of indirect evidence include student notes, teacher observation recording sheets or photographic evidence of the process.

Further guidance can be found in the QCE and QCIA policy and procedures handbook.

Conditions of assessment

Over a four-unit course of study, students are required to complete assessment under a range of conditions (see Planning an assessment program).

Conditions may vary according to assessment. They should be stated clearly on assessment instruments and reflect the conditions stated for each assessment technique.

Where support materials or particular equipment, tools or technologies are used under supervised conditions, schools must ensure that the purpose of supervised conditions (i.e. to authenticate student work) is maintained.

Assessment of group work

When students undertake assessment in a group or team, instruments must be designed so that teachers can validly assess the work of individual students and not apply a judgment of the group product and processes to all individuals.

3.2.1 Project

Purpose

This technique assesses a response to a single task, situation and/or scenario in a module of work that provides students with authentic opportunities to demonstrate their learning in both 'Industry practices' and 'Production processes'. The student response will consist of a collection of **at least two** assessable components, demonstrated in different circumstances, places and times, and may be presented to different audiences and through different modes.

Dimensions to be assessed

This assessment technique is to be used to determine student achievement in objectives from all of the following dimensions:

- Knowing and understanding
- Analysing and applying
- Producing and evaluating.

All objectives from each dimension must be assessed.

Types of projects

A project occurs over a set period of time. Students may use class time and their own time to develop a response.

A project involves students demonstrating and documenting 'Industry practices' and 'Production processes' when creating a product to predefined specifications.

A project consists of a **product component** and at least one of the following components:

- written
- spoken
- multimodal.

The selected assessable components must contribute significantly to the task and to the overall result for the project. A variety of technologies may be used in the creation or presentation of the response.

Note: Spoken delivery of a written component, or a transcript of a spoken component (whether written, electronic or digital), constitutes one component, not two.

Examples of projects in Furnishing Skills include:

- plan and create, using 'Industry practices' and 'Production processes', a vanity cabinet to technical drawing specifications:
 - product component: vanity cabinet
 - multimodal component: individual digital portfolio documenting industry practices and production processes that may include selection and sequence of production procedures, materials, tools, management of time, safety, cost and expectations of quality
 - spoken component: oral presentation evaluating how the vanity cabinet met specifications, making recommendations for improvements and/or suggesting alternatives to improve production processes and the finished vanity cabinet
- work in a team, using 'Industry practices' and 'Production processes', to manufacture a children's picnic table setting:
 - product component: scope of practical work assigned to an individual student in the production of a children's picnic table setting
 - multimodal component: individual photographic production journal with annotations
 - spoken component: individual podcast of an evaluation of the quality and suitability of the children's picnic table setting, outlining why it could be offered for sale in the school community
- plan and create, using 'Industry practices' and 'Production processes', an outdoor chair to technical drawing specifications:
 - product component: an outdoor chair
 - written component: documentation of industry practices and production processes that may include selection and sequence of production procedures, materials, tools, management of time, safety, cost and expectations of quality, e.g. logbooks, e-journals and diaries.

Product component		
<p>This component refers to the creation of a product that meets predefined specifications. Students apply a range of cognitive, technical and physical skills to demonstrate knowledge, understanding and skills in 'Industry practices' and 'Production processes'.</p> <p>Students are given specifications (working drawings and technical information) and may use class time and their own time to complete a functional product that meets the specifications.</p>		
Written component		
<p>This component requires students to use written language to communicate ideas and information to readers for a particular purpose. A written component may be supported by subheadings, references or, where appropriate, data, tables, flowcharts or diagrams.</p>		
Spoken component		
<p>This component requires students to use spoken language to communicate ideas and information to a live or virtual audience (i.e. through the use of technology) for a particular purpose.</p>		
Multimodal component		
<p>This component requires students to use a combination of at least two modes delivered at the same time to communicate ideas and information to a live or virtual audience for a particular purpose. The selected modes are integrated to allow both modes to contribute significantly to the multimodal component. Modes include:</p> <ul style="list-style-type: none"> • written • spoken/signed • nonverbal, e.g. physical and visual. <p>The multimodal component can be a presentation or non-presentation. Examples of presentations include delivery of a slide show, short video clip or webinar. Examples of non-presentations include a webpage with embedded media (graphics, images, audio or video) or a digital portfolio documenting the planning, organising and implementation of a production process with text, sketches and photographs.</p> <p>A variety of technologies may be used in the creation or presentation of the component. Replication of a written document into an electronic or digital format does not constitute a multimodal component.</p>		
Assessment conditions	Units 1–2	Units 3–4
Written component	400–700 words	500–900 words
Spoken component	1½ – 3½ minutes	2½ – 3½ minutes
Multimodal component <ul style="list-style-type: none"> • non-presentation • presentation 	6 A4 pages max (or equivalent) 2–4 minutes	8 A4 pages max (or equivalent) 3–6 minutes
Product component	Schools give students a set period of in-class time to develop the product component/s of their project.	

Further guidance

- It is the responsibility of teachers and students to present the evidence to support the standard awarded.
- When students undertake assessment in a team, instruments must be designed so that teachers can validly assess the work of individual students and not apply a judgment of the group product and processes to all individuals.
- Supporting evidence may include:
 - annotated instrument-specific standards
 - visual evidence of the product
 - documentation.
- Allow class time for the student to effectively undertake each component of the project assessment. Independent student time will be required to complete the task.
- The required length of student responses should be considered in the context of the tasks.
- Implement strategies to promote the authenticity of student work. Strategies may include note-taking, drafting and/or teacher observation sheets.
- Scaffolding is part of the teaching and learning that supports student development of the knowledge, understanding and skills needed to complete an assessment task and demonstrate what the assessment requires. Scaffolding should be reduced in Units 3 and 4 as students develop greater independence as learners.
- Clearly indicate the dimensions and objectives that will be assessed and explain to students the requirements of the task, including instrument-specific standards.
- Give students learning experiences in the use of appropriate communication strategies.
- Teach the requirements for each component of the project, e.g. sketches, diagrams, journals, digital equipment use and referencing.

3.2.2 Practical demonstration

Purpose		
This technique assesses the practical application of a specific set of teacher-identified production skills and procedures. Responses are completed individually in a set timeframe.		
Dimensions to be assessed		
This assessment technique is to be used to determine student achievement in objectives from all of the following dimensions:		
<ul style="list-style-type: none"> • Knowing and understanding • Analysing and applying • Producing and evaluating. Not every objective from each dimension needs to be assessed.		
Types of practical demonstration		
A practical demonstration involves students demonstrating production skills and procedures over a set period of time. Students are given specifications (such as a drawing, a template or written instructions) and use class time under teacher supervision.		
Examples of practical demonstrations in Furnishing Skills include:		
<ul style="list-style-type: none"> • a jointing exercise to produce a trivet frame • a wood-turning task. 		
Assessment conditions	Units 1–2	Units 3–4
Practical demonstration	A set period of in-class time	
Further guidance		
<ul style="list-style-type: none"> • Schools provide students with continuous class time to develop and practise production skills and procedures. • Practical demonstrations should increase in complexity and variety over the course of study. • Practical demonstration evidence could include: <ul style="list-style-type: none"> – visual evidence of practical demonstration, e.g. annotated photographs – student workbooks – teacher observations annotated on instrument-specific standards. • There should be evidence of student work to support the standards awarded. 		

3.2.3 Examination

Purpose

This technique assesses the application of a range of cognition to provided questions, scenarios and/or problems. Responses are completed individually, under supervised conditions and in a set timeframe.

Dimensions to be assessed

This assessment technique may be used to determine student achievement in objectives from the following dimensions:

- Knowing and understanding
- Analysing and applying
- Producing and evaluating.

Not every objective from each dimension needs to be assessed.

Type of examination

Short response test

- Short response tests typically consist of a number of items that may include students responding to some or all of the following activities:
 - drawing, labelling or interpreting equipment, graphs, tables or diagrams
 - calculating using algorithms
 - responding to seen or unseen stimulus materials
 - interpreting ideas and information.
- Short response tests occur under supervised conditions as students produce work individually and in a set time to ensure authenticity.
- Questions, scenarios and problems are typically unseen. If seen, teachers must ensure the purpose of this technique is not compromised.
- Stimulus materials may also be used and may be seen or unseen.
- Unseen questions, statements or stimulus materials should not be copied from information or texts that students have previously been exposed to or have directly used in class.

Assessment conditions	Units 1–2	Units 3–4
Recommended duration	60–90 minutes	60–90 minutes
Short response test	50–150 words per item (diagrams and workings not included in word count)	50–250 words per item (diagrams and workings not included in word count)

Further guidance

- Format the assessment to allow for ease of reading and responding.
- Consider the language needs of the students and avoid ambiguity.
- Ensure questions allow the full range of standards to be demonstrated.
- Consider the instrument conditions in relation to the requirements of the question/stimulus.
- Outline any permitted material in the instrument conditions, e.g. one page of handwritten notes.
- Determine appropriate use of stimulus materials and student notes. Ensure stimulus materials are succinct enough to allow students to engage with them in the time provided; if they are lengthy, consider giving students access to them before the assessment.
- Provide students with learning experiences that support the types of items, including opportunities to respond to unseen tasks using appropriate communication strategies.
- Indicate on the assessment the dimensions and objectives that will be assessed, and explain the instrument-specific standards.

3.3 Exiting a course of study

3.3.1 Folio requirements

A folio is a collection of one student's responses to the assessment instruments on which exit results are based. The folio is updated when earlier assessment responses are replaced with later evidence that is more representative of student achievement.

3.3.2 Exit folios

The exit folio is the collection of evidence of student work from Units 3 and 4 that is used to determine the student's exit result. Each folio must include:

- four assessment instruments, and the student responses
- evidence of student work from Units 3 and 4 only
- at least two projects
- at least one practical demonstration (separate to the assessable component of a project).
- a student profile completed to date.

3.3.3 Exit standards

Exit standards are used to make judgments about students' exit result from a course of study. The standards are described in the same dimensions as the objectives of the syllabus. The standards describe how well students have achieved the objectives and are stated in the standards.

The following dimensions must be used:

- Dimension 1: Knowing and understanding
- Dimension 2: Analysing and applying
- Dimension 3: Producing and evaluating.

Each dimension must be assessed in each unit, and each dimension is to make an equal contribution to the determination of an exit result.

3.3.4 Determining an exit result

When students exit the course of study, the school is required to award each student an A–E exit result.

Exit results are summative judgments made when students exit the course of study. For most students, this will be after four units. For these students, judgments are based on exit folios providing evidence of achievement in relation to all objectives of the syllabus and standards.

For students who exit before completing four units, judgments are made based on the evidence of achievement to that stage of the course of study.

Determining a standard

The standard awarded is an on-balance judgment about how the qualities of the student's responses match the standards descriptors in each dimension. This means that it is not necessary for the student's responses to have been matched to every descriptor for a particular standard in each dimension.

Awarding an exit result

When standards have been determined in each of the dimensions for this subject, Table 2 below is used to award an exit result where A represents the highest standard and E the lowest. The table indicates the minimum combination of standards across the dimensions for each result.

Table 2: Awarding an exit result

Exit result	Minimum combination of standards
A	Standard A in any two dimensions and no less than a B in the remaining dimension
B	Standard B in any two dimensions and no less than a C in the remaining dimension
C	Standard C in any two dimensions and no less than a D in the remaining dimension
D	At least Standard D in any two dimensions and an E in the remaining dimension
E	Standard E in the three dimensions

Further guidance can be found in the QCE and QCIA policy and procedures handbook.

3.3.5 Standards matrix

	Standard A	Standard B	Standard C	Standard D	Standard E
Knowing and understanding	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> comprehensive description of industry practices in manufacturing tasks consistent and proficient demonstration of fundamental production skills informed and accurate interpretation of drawings and technical information. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> detailed description of industry practices in manufacturing tasks effective demonstration of fundamental production skills effective interpretation of drawings and technical information. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> description of industry practices in manufacturing tasks demonstration of fundamental production skills interpretation of drawings and technical information. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> statements about industry practices in manufacturing tasks partial demonstration of aspects of fundamental production skills statements about drawings and technical information. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> inconsistent statements of industry practices minimal demonstration of aspects of fundamental production skills inconsistent statements about drawings and technical information.
	Analysing and applying	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> thorough analysis of manufacturing tasks to proficiently organise materials and resources discerning selection and proficient application of production skills and procedures in manufacturing tasks coherent and succinct use of visual representations, language conventions and features to communicate for particular purposes. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> effective analysis of manufacturing tasks to organise materials and resources relevant selection and purposeful application of production skills and procedures in manufacturing tasks effective use of visual representations, language conventions and features to communicate for particular purposes. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> analysis of manufacturing tasks to organise materials and resources selection and application of production skills and procedures in manufacturing tasks use of visual representations, language conventions and features to communicate for particular purposes. 	<p>The student work has the following characteristics:</p> <ul style="list-style-type: none"> partial analysis of manufacturing tasks to organise some materials and resources partial application of aspects of production skills and procedures in manufacturing tasks vague use of visual representations, language conventions and features to somewhat communicate.

Producing and evaluating	The student work has the following characteristics:	The student work has the following characteristics:	The student work has the following characteristics:	The student work has the following characteristics:	The student work has the following characteristics:
	<ul style="list-style-type: none"> • thorough planning and discerning adaptation of production processes • proficient creation of products that meet specifications • discerning evaluation of industry practices, production processes and products, and valid recommendations made. 	<ul style="list-style-type: none"> • effective planning and adaptation of production processes • methodical creation of products that meet specifications with minor variations • effective evaluation of industry practices, production processes and products, and plausible recommendations made. 	<ul style="list-style-type: none"> • planning and adaptation of production processes • creation of products from specifications • evaluation of industry practices, production processes and products, and recommendations made. 	<ul style="list-style-type: none"> • partial planning of production processes • creation of incomplete products with obvious variation from specifications • superficial evaluation of industry practices, production processes and products, and simple recommendations made. 	<ul style="list-style-type: none"> • minimal planning of some production processes • creation of aspects of products • statements about industry practices, production processes or products.

4 Glossary

Term	Explanation
A	
accurate	precise and exact; consistent with a standard, rule, convention or known facts
analyse; analysis	to consider in detail for the purpose of finding meaning or relationships, and identifying patterns, similarities and differences
apply; application	use, utilise or employ in a particular situation
aspects	components, elements
C	
clear	easy to understand; explicit; without ambiguity
coherent	well-structured and logical; internally consistent relation of parts
communicate; communication	convey knowledge and/or understandings to others
components	parts or elements that make up a whole object and perform specific functions
composite materials	<p>materials made from two or more constituent materials with significantly different physical or chemical properties that, when combined, produce a material with characteristics different from the individual components; the individual components remain separate and distinct within the finished structure</p> <p>The new material may be preferred for many reasons: common examples include materials which are stronger, lighter or less expensive when compared to traditional materials.</p> <p>Typical engineered composite materials include:</p> <ul style="list-style-type: none"> • composite building materials such as cements and concrete • reinforced plastics such as fibre-reinforced polymer • metal composites • ceramic composites (composite ceramic and metal matrices). <p>(Also called 'composition materials' or shortened to 'composites'.)</p>
comprehensive	thorough, including all that is relevant
computer-aided drafting	software used by drafters, architects and engineers to help them create lines, shapes and planes that can be combined, moved, rotated, adjusted and rendered; measurements and calculations can be included; computer-aided drafting can be used to create 2D and 3D models and drawings such as floor plans and rendered pictorial views of objects and structures; also known as computer-assisted design, computer-aided drawing or CAD
considered	formed after careful (deliberate) thought
consistent	agreeing or accordant; compatible; not self-opposed or self-contradictory; constantly adhering to the same principles
create	put elements together to form a coherent or functional whole; the synthesis of knowledge and skills in industry practices and production processes to manufacture a functional product to predefined specifications

Term	Explanation
D	
describe; description	giving an account of characteristics or features
detailed	meticulous; including many of the parts
diaries	documents that record the stages of manufacture when completing a functional product; may be supported by subheadings, references or, where appropriate, symbols, data, tables, flowcharts or diagrams
digital portfolio	an engaging and effective way for students to showcase their work and reflect on the learning process; can be either offline or online, or a combination of both; in the classroom, a digital portfolio is usually used to showcase learning and reflections over a period of time, and may provide evidence towards assessment
discerning	showing good judgment to make thoughtful choices
documentation	documentation of industry practices and production processes may include selection and sequence of production skills and procedures, materials, tools, management of time, safety, cost and expectations of quality in forms such as production plans, logbooks, e-journals and diaries; documentation is required for the written component of the project — it requires students to use written language to communicate ideas and information to readers for a particular purpose; may be supported by subheadings, references or, where appropriate, symbols, data, tables, flowcharts or diagrams Teachers should explain to students the purpose and type of documentation they require; students are required to keep track of production procedures completed; this may be used as evidence towards assessment.
drawings	a range of graphical representations used to communicate information to particular audiences; produced manually or with CAD software systems; there are two main types of drawings used in Furnishing Skills — sketches and technical drawings
drawing standards	industry conventions and general principles for technical drawing, including dimensioning, types of lines and layouts to use, scales, symbols, abbreviations and their meanings; Australian standard AS 1100 for engineering and technical drawing includes a number of parts that describe the conventions for Australian engineers, designers, architects and associated tradespeople such as builders and plumbers to follow
E	
effective	meeting the assigned purpose
e-journals	electronic journals are able to be accessed via electronic transmission; may follow the format for production plans, logbooks or diaries; completed by students and able to show production processes completed; may be supported by subheadings, references or, where appropriate, symbols, data, tables, flowcharts or diagrams
equipment	items needed for carrying out specific jobs, activities, functions or procedures that area not usually identified in industry as a tool or machine, e.g. portable bench, saw stool, tool bag
evaluate; evaluation	assign merit according to criteria; examine and judge the merit, significance or value of something
explain; explanation	provide additional information that demonstrates understanding of reasoning and/or application

Term	Explanation
F	
flat pack	a piece of furniture or other equipment that is sold in pieces packed flat in a box for easy transport and assembled by the buyer
functional	complete and ready for use or service; these products have been manufactured to specifications and are ready for sale or use by the customer/consumer
fundamental	essential foundation or basis on which other aspects are built
I	
identify; identification	distinguish, isolate; locate and recognise
J	
jigs	custom-made tools or pieces of equipment used to control the positioning and/or motion of another tool to go into a work piece; jigs are used when manufacturing products to ensure accuracy, alignment, repeatability and interchangeability; some jigs are also called templates or guides; examples are machining jigs, woodworking jigs such as a dowelling jig, jewellers' jigs and welders' jigs
joining	methods of bringing together and permanently holding materials or components, e.g. a dowel joint to join legs and rails for a table frame, fasteners such as nails, rivets, bolts and screws, glues or adhesives, welding
L	
logbook	the systemic daily record of activities, events and/or occurrences; it is a method of keeping track of the production processes completed by students; a logbook incorporates quality control procedures, which means that the functional product is constantly checked during manufacture — this should ensure that the finished item is manufactured to a high standard; may be supported by subheadings, references or, where appropriate, symbols, data, tables, flowcharts or diagrams
limited	confined within limits; restricted, circumscribed or narrow
M	
manufacturing enterprise	a business entity set up to generate profit by making and selling products to wholesalers, retailers or customers/consumers
manufacturing industry	organised economic activity connected with the manufacture of a particular product or range of products; manufacturing industries employ people, tools and equipment to processes raw materials into products
methodical	carried out systematically; orderly
module of work	<p>a module of work provides effective teaching strategies and learning experiences that facilitate students' demonstration of the dimensions and objectives as described in the syllabus</p> <p>A module of work:</p> <ul style="list-style-type: none"> • draws from relevant aspects of the underpinning factors • identifies relevant concepts and ideas, and associated subject matter from the core topics • provides an alignment between core subject matter, learning experiences and assessment.

Term	Explanation
O	
obvious	clearly perceptible or evident; easily recognised; open to view
orthogonal drawings	scaled, multi-view drawings of a 3D object to show each view separately in a series of 2D drawings, e.g. top or bottom, front, back and sides; in Australia, orthogonal drawings use third-angle projection for layout of the views; orthogonal drawings may also include the measurements on each view and are used to develop lists of material requirements; in these drawings each edge is represented by a connected line, each segment of which is parallel to a coordinate axis
P	
partial	attempted, with evidence provided, but incomplete
personal protective equipment	equipment used or worn by a person to minimise risk to the person's health or safety, e.g. goggles, ear muffs, face shield, hard hat, apron, gloves
plausible	credible and possible
production plans	a list of the production processes required to be completed when manufacturing a functional product; these are a school-developed planning tool and are created by teachers and/or students; may be supported by subheadings, references or, where appropriate, symbols, data, tables, flowcharts or diagrams
product	a tangible end result of manufacturing that could be offered for sale; created by the practical application of knowledge and skills in 'Industry practices' and 'Production processes'
production procedure	established step-by-step ways of using materials, tools and machinery to achieve a purpose; production procedures include safely setting up and using hand/power tools and machinery to mark out, cut, join, form, fabricate and finish materials
production skill	know-how (practical knowledge) and manual dexterity required to use materials, tools and machinery; production skills include safe and correct operation of hand/power tools and machinery, maintenance of tools and equipment, measuring techniques, safe work practices and general housekeeping
proficient	skilled and adept; well advanced or expert
purposeful	having an intended or desired result
Q	
quality	the standard or grade of something; quality standards of products are derived from customer/consumer expectations of value
R	
recommend; recommendation	make a suggestion or proposal as to the best course of action
relevant	applicable and pertinent; has direct bearing on
S	

Term	Explanation
scale	the relationship between the actual size of an object and its representation on a drawing, map or model; a scale may be a reduction or enlargement of the actual size of an object, often so it will fit on a page or be more manageable to draw or represent, e.g. house plans usually use a scale of 1:100 to represent the floor plan on A3 paper
scope of practical work	the production processes required to complete a manufacturing task; assigned to individual students, it involves a range of procedures, e.g. marking out procedures, machining procedures, assembly procedures and finishing procedures; the opportunity for students to engage in a range of procedures when undertaking a manufacturing task
simple	involving few elements, components or steps; obvious data or outcomes
sketch	a drawing completed freehand, often instantly capturing an idea for later use and therefore lacking in presentation quality; sketches are usually produced manually but may be software-assisted; they may include annotations, e.g. dimensions and materials
skill exercise	a practical activity typically completed using a narrow range of production skills and procedures; skill exercises allow students safe opportunities to develop know-how and manual dexterity with materials and tools; examples include turning a plumb bob on a metal lathe, arc welding a bracket
specifications	sketches, technical drawings and other technical information used to manufacture a product to customer expectations
statement	a sentence or assertion
succinct	brief, concise and clear
T	
technical drawing	orthographic and pictorial graphical representations (based on underlying mathematical frameworks) used to communicate how something functions or is to be manufactured; technical drawings are drafted to industry conventions that specify common symbols, units of measurement, notation, visual style and page layout; they are usually produced using computer-aided drafting (CAD) software
technical information	industry-specific information required to manufacture a product that is not available on a technical drawing but is crucial to the successful production process; technical information can be accessed from charts, templates, tables, manuals and schedules, e.g. set-up procedures, speeds and feeds, drill sizes for tapping, gas pressures, span distances and standard operating procedures (SOP)
thorough	attentive to detail; carried out through or applied to the whole of something
thumbnail sketch	small sketch usually done quickly by tradespeople, designers, architects and engineers to indicate roughly what an object, system or environment could look like; thumbnail sketches are a method of visualising thinking and show main features rather than minor details; they may include annotations
U	
unit	a unit is a minimum of 55 hours of timetabled school time, including assessment. A course of study will usually be completed over four units (220 hours).
V	

Term	Explanation
